

SAS Upgrade License Instructions Server-Client Version

In this section, we will refer to

- a user account with administrative privileges over the server machine as ***admin***.
- the machine where the SAS files are being stored as the ***SAS server*** or simply ***server machine***.
- the machine from where SAS users access SAS as the ***SAS client*** or simply as ***client machine***.

For the license update you will need the latest "setinit.sss" file.

For a client-server installation of SAS, the license update needs to be done on the SAS server just once, and the update is reflected for all the SAS clients that connect to that server. However to do this, all updates must be done from a client machine and not directly on the SAS server. This is explained below.

License Update steps:

1. Ensure that the SAS installation directory on the *SAS server* is accessible over the network to *admin* with write permissions.
2. Log in to any one of the client machines with the *admin* user account.
3. Ensure that you have access to the setinit.sss file (for the new license) that was sent to you.
4. Open SAS on the client machine. Make sure at least the 'Log' window is open. If it is not, open it by navigating to "View > Log".
5. Next open the setinit.sss file within SAS. (Navigate to "File > Open..." , and choose the new setinit.sss file from the appropriate location).
6. Click on the 'run' icon on the toolbar (when you move your mouse over the icon it shows 'Submit').
7. The SAS Log window should show the message: "NOTE: Siteinfo data have been updated".
